Blackout

Is Your Organisation Prepared?

PAINS - NEEDS

Home healthcare providers do not seem to be sufficiently prepared for a blackout, i.e. a widespread and prolonged power failure. It would therefore not be possible to maintain service operations in the event of an emergency like a major power outage.

GAINS

In the event of a blackout, well-prepared home healthcare providers could prevent problems for both themselves, but also the patients dependent on their care. The staff of the supporting organizations should also be ready for a possible blackout.

EXISTING PROBLEMS

The consequences of a blackout are understood very differently by the various providers of outpatient home care services.

For some, precautions are essential, and others find preparation something to consider. However, some negate the problem itself and do not seem willing to take preventive measures.

THE CHALLENGE

The challenge is to create a product that sensitizes healthcare providers to blackout preparation and shows real possible consequences.

The product should also support the providers of home care in developing contingency plans that ensure both the ability of the employees to work and the continuation of internal workflows in the event of a blackout.
